

OHARA

Theme & Color Implementation Specification

Light mode + dark mode
Figma-to-code handoff for engineering and Claude

VERSION 1.0 / JULY 20, 2026

Document intent

This document tells implementation AI what each color means, where each token belongs, which current screens are incorrect, and how to verify a complete light/dark theme pass. It is written to reduce aesthetic guesswork and prevent new hardcoded colors.

Prepared as an implementation source of truth for OHARA UI/UX and engineering.

1. How to Use This Specification

This document is both a design handoff and an AI implementation brief. It should be attached or pasted into the engineering conversation before Claude edits theme-related code.

1.1 Source-of-truth order

- 1 Semantic intent and non-negotiable rules in this document.
- 2 Exact values in constants/colors.ts: LIGHT_THEME and DARK_THEME.
- 3 The approved Figma frames, especially the paired Today's Focus reference.
- 4 Existing derived tokens that are centrally defined and marked in code.
- 5 Current implementation screenshots only as evidence of problems - never as a source for sampling new colors.

1.2 Version note

Exact core colors are already included

The current registry provides exact IDs for the principal page, card, text, divider, and accent tokens. Values labeled derived should remain centralized in colors.ts and should not be replaced with locally guessed hex values. Additional Figma IDs can be added later without changing the semantic rules in this document.

1.3 What this implementation must not change

- No layout, spacing, content, navigation, or data behavior changes during the color pass.
- No new palette families and no additional greens, blues, oranges, or mint tones.
- Do not modify GOAL_THEMES in the first theme-wiring pass. Audit its contrast separately.
- Modal scrims remain theme-invariant unless UI/UX explicitly changes that decision.
- Do not rewrite components merely to apply colors; use the existing theme hook and semantic tokens.

1.4 Deliverable expected from Claude

A complete implementation should return: (1) files changed, (2) hardcoded colors removed, (3) semantic tokens used, (4) screenshots or a review summary for both themes, and (5) unresolved design questions. It should never silently invent a visual decision.

2. Design Intent and Non-Negotiable Rules

OHARA should feel calm, premium, organic, quiet, and reflective. The interface supports focus and personal growth; it should not resemble a game dashboard or a high-saturation productivity tool.

2.1 Theme character

Mode	Intended character	Avoid
Light mode	Warm premium paper. Page surfaces are off-white; elevated cards may be white.	Large pure-white page areas, cold grays, bright mint, excessive outlines.
Dark mode	Near-black charcoal with softly separated surfaces. Cards are slightly lighter than the page.	Pure inversion, white cards, neon accents, strong shadows, high-contrast panel blocks.

2.2 Hierarchy order

Create hierarchy in this order:

- 1 Typography
- 2 Spacing
- 3 Surface separation
- 4 Borders or elevation
- 5 Accent color

Accent color is the final lever, not the first. A screen should remain understandable if the green accent is temporarily removed.

2.3 Accent rule

Green communicates guidance

Use accent green for progress, primary actions, selected navigation, links, and small growth-oriented highlights. It must not become the dominant color of a screen. As a visual rule of thumb, keep accent usage to roughly 5-10% of the visible interface.

2.4 Global rules

- When uncertain, choose the more neutral semantic token.
- Do not increase saturation to make an element visible. Improve hierarchy with typography, spacing, or surface contrast.
- Components of the same semantic type must share the same surface, text, and border tokens.
- Dark mode is not a mathematical inversion of light mode. Preserve relationships, not raw brightness.
- Borders should nearly disappear. Users should notice spacing and grouping before outlines.
- Icons inherit the adjacent text color unless they communicate success, warning, danger, information, or a primary action.

3. Canonical Core Token Registry

These values are the current canonical IDs supplied in the team registry. They are the implementation source of truth; do not sample colors from screenshots.

OHARA Core Theme Tokens

LIGHT MODE

	background.page #F8F4EC
	background.card #FFFFFF
	text.primary #211F1A
	text.secondary #8A8172
	border.divider #E8E5DF
	accent.primary #4A7C5F

DARK MODE

	background.page #111111
	background.card #1A1A1A
	text.primary #FFFFFF
	text.secondary #B8B8B8
	border.divider #2D2D2D
	accent.primary #8FAE8A

Use token values as the source of truth. Screenshots are visual references, not a color-sampling source.

Core light/dark values currently confirmed in the Figma palette.

Token	Light	Dark	Required usage
background.page	#F8F4EC	#111111	Root page/canvas surface.
background.card	#FFFFFF	#1A1A1A	Standard card, modal, pane, and elevated content surface.
text.primary	#211F1A	#FFFFFF	Headings, titles, important content.
text.secondary	#8A8172	#B8B8B8	Descriptions, dates, metadata, supporting copy.
border.divider	#E8E5DF	#2D2D2D	Dividers and quiet card separation.
accent.primary	#4A7C5F	#8FAE8A	Primary actions, progress, selected states, links.
text.accent	#4A7C5F	#8FAE8A	Text role that intentionally reuses accent.primary.
border.accent	#4A7C5F	#8FAE8A	Only when a genuinely interactive/accent border is required.
brt.bud	#4A7C5F	#8FAE8A	Brand/illustrative role that intentionally reuses accent.primary.

3.1 Important relationships

- Light mode: background.page is warm off-white; background.card is the only standard white elevated surface.
- Dark mode: background.page is #111111; background.card is #1A1A1A. A dark screen must never render a standard card as #FFFFFF.
- The dark divider #2D2D2D provides subtle separation without a visible outline-heavy appearance.
- The dark accent #8FAE8A is a muted sage. Do not substitute turquoise, mint, or neon green.

4. Derived Tokens and Semantic Color Roles

Several existing values were derived because Figma did not include an explicit dark swatch. The implementation rule is to preserve these tokens centrally and wire components to them. Claude should not guess replacements inside component files.

Token family	Current status	Implementation instruction
background.sidebar	Light #1E3226; dark derived	Use the central token. Do not hardcode a sidebar green in the shell or navigation rows.
background.input / subtle / goalCard / selectedRow	Derived	Use only for their named semantic role. Do not substitute background.card because a value is unknown.
text.inverse / muted / mutedOnDark	Derived	Use inverse only on filled/dark surfaces; muted for de-emphasized content; mutedOnDark only on dark-only surfaces.
border.default / subtle	Inverted rgba pairs	Use for quiet structural boundaries. Avoid new rgba values in components.
border.warm / warmSubtle / input / toggleGlyph	Derived	Keep central. These are component-role borders, not palette choices.
accent.teal family	Derived	Do not use as a generic alternative accent. Use only where the existing semantic role explicitly calls for it.
brt.rose / thorn	Derived	Keep within their brand/illustrative roles. Do not use for general UI decoration.
feedback.danger	bg / border / text triad	Use the complete semantic triad for destructive or failed states.
feedback.pending	bg / border / text triad	Use only for pending or limit states.
feedback.info	bg / border / text triad	Use for saved-with-caveat or minor informational notices.

4.1 Decision test for every color

Ask in this order:

1. Is this a page, card, input, selected row, or other named surface? -> use background.*
2. Is this primary, supporting, muted, inverse, or interactive text? -> use text.*
3. Is this a divider, quiet boundary, input outline, or accent boundary? -> use border.*
4. Is this a primary action, selected state, link, or progress fill? -> use accent.primary
5. Is this a status? -> use the complete feedback.* triad
6. Is there still no semantic match? -> report the gap; do not add a local hex value

4.2 Token creation rule

A new token is permitted only when the same semantic need recurs across multiple components and no existing role accurately describes it. New tokens must be added once to both LIGHT_THEME and DARK_THEME, documented, and consumed through useThemeColors().

5. Component and Screen Mapping

The table below tells Claude what is already wired and where the next changes belong. Status reflects the latest team document.

5.1 App shell and shared typography

Area	Token behavior	Status / instruction
Authenticated shell + sidebar	background.sidebar, background.page, border.divider	Wired. Confirm all descendants inherit theme values rather than local colors.
Shared modal surfaces	background.card, border.divider	Wired. Keep scrim theme-invariant.
Settings - Appearance	background.card, text.primary, text.secondary	Wired. Theme toggle remains here until another trigger is approved.
Typography .tsx	31 of 35 variants mapped to text.*	Preserve centralized mapping. Do not override colors in screens without a semantic reason.
emphasis-sm	No assigned color	Proposed default: text.primary; flag for UI/UX confirmation.
active-goal-title	No assigned color	Proposed default: text.primary; flag for UI/UX confirmation.
badge-text	No assigned color	Do not assign one global color. Split filled and neutral badge roles, or let the badge component provide the semantic color.

5.2 Echo

Component	Expected tokens	Status
EchoScreen	background.page, border.divider	Wired
EchoContainerTree	background.card, text.primary, text.secondary	Wired
GoalFolderPicker	background.card, text.primary, text.secondary	Wired
EchoPaneResizer	border.divider	Wired
EchoComposer	text.*, feedback.danger.*, feedback.info.*, feedback.pending.*	Wired
CreateFolderModal	text.*, feedback.danger; invariant scrim	Wired
EchoDetailPane / EntryList / Row / FilterPill	background.card, text.*, light shadow only	Wired; dark mode uses shadow-none
EchoTrail	Match the same Echo card/read-only feed treatment	Not wired - priority after dashboard

5.3 Remaining implementation priority

Priority	Area / component	Current issue	Required action
P0	dashboard.tsx	Partially wired; roughly 20 hardcoded colors remain.	Replace surfaces, rings, borders, progress, icons, and actions with semantic tokens.
P0	Today's Focus / dashboard empty state	Dark mode visibly renders a light card and mint accents.	Apply canonical card, text, divider, and accent relationships shown in Section 7.
P1	ExtendGoalModal	Approximately 54 inline colors - largest single hotspot.	Remove raw colors; map each role to existing tokens.
P1	Goal Detail page	Not wired; also consumes GOAL_THEMES.	Wire normal UI chrome; preserve GOAL_THEMES for separate audit.
P1	Goal Create screen	Theme imports mixed with raw hex fallbacks.	Remove fallbacks; rely on complete theme values.
P1	MeasurableCard / GoalDetailHeader	Not wired.	Use standard card/text/border tokens; keep goal-theme graphics separate.
P1	VaultItemCard / Vault page	Imports light colors directly or is unwired.	Use useThemeColors(); remove direct LIGHT_THEME imports.
P2	Project Detail / CreateProjectModal	Not wired.	Apply standard semantic mapping after Journey is stable.
P2	Constellation screen / samples	Not wired.	Theme container UI first; assess decorative graphics separately.

Rename note

The product-facing area is now called Journey. Internal filenames and variables may still use goals. Do not rename internal identifiers as part of the theme pass; this avoids unrelated risk.

5.4 GOAL_THEMES boundary

GOAL_THEMES in constants/themes.ts is intentionally independent of light/dark mode. The first implementation pass must not alter it. After all standard UI surfaces are correct, visually check each gradient against #F8F4EC, #FFFFFF, #111111, and #1A1A1A. Report any contrast failures as a separate design review.

6. Current Dashboard - Corrections Required

The screenshot below demonstrates a theme that is technically dark at the page level but visually inconsistent at the component level. The numbered callouts identify the most important corrections.

Current implementation screenshot with implementation callouts.

1. Hero / empty-state surface

The large dashboard card is rendering as a light-mode card in dark mode. Replace any fixed #FFFFFF or light theme import with background.card. Expected dark value: #1A1A1A. Its boundary should use border.divider or the existing quiet border token, not an accent outline.

2. Mint/cyan accent drift

The icon, border, and Create a goal action use a brighter mint than the approved dark accent. Use accent.primary / text.accent / border.accent only where their semantic role applies. Expected dark accent: #8FAE8A. Remove accent from the standard card border.

3. Selected navigation

The selected Journey row must use the central selected-row treatment. Do not hardcode a new green fill. The icon and label should use the chosen selected-state text/icon token consistently; inactive rows should remain neutral or muted.

4. Echo card

Use background.card #1A1A1A and border.divider #2D2D2D. Dark mode should not rely on a shadow. Button/action text may use accent.primary, while descriptive copy remains text.secondary.

5. Progress track

The long white bar is inconsistent with the approved dark palette. A progress track should be a quiet neutral such as the existing divider/subtle token; only the completed segment uses accent.primary. If the bar is not progress, map it to its actual semantic component rather than styling it as a white decoration.

7. Today's Focus - Canonical Visual Reference

The paired Figma frame below is the primary visual reference for card hierarchy. Match its relationships rather than copying isolated pixel colors from the screenshot. The card should feel calm and contained: separate from the page without becoming a bright panel, with green reserved for selected, progressive, or actionable elements.

Approved light and dark examples of the Today's Focus card.

Element	Light mode	Dark mode	Semantic token / rule
Page behind card	Warm off-white	Near-black charcoal	background.page
Card surface	White	Slightly lighter charcoal	background.card
Card boundary	Warm, quiet line	Very subtle dark divider	border.divider or designated warm border token
Card heading + chevron	Accent/dark olive treatment	Muted sage accent	Use approved heading role plus accent for intentional interaction; do not tint all body text.
Goal label	Primary or supporting neutral	Primary neutral	text.primary or text.secondary based on established Typography variant.
Main message	Highest text emphasis	Highest text emphasis	text.primary
Progress fill	Muted green	Muted sage	accent.primary
Progress remainder	Warm subtle neutral	Dark subtle neutral	background.subtle or border.divider - never pure white in dark mode.
Metadata	Quiet neutral	Quiet gray	text.secondary or text.muted
Divider above action	Quiet divider	Quiet divider	border.divider
Primary button	Muted green fill + inverse text	Muted sage fill + inverse/appropriate high-contrast text	accent.primary + text.inverse (verify contrast).

8. Reusable Component Rules

Surfaces

Page uses background.page. Standard cards, modals, and panes use background.card. Inputs, selected rows, subtle sections, and goal cards use their dedicated background tokens. Never use a light-mode surface as a fallback in dark mode.

Typography

Primary text is reserved for the most important information. Secondary text handles descriptions, dates, metadata, and supporting instructions. Muted text is for hints, disabled states, and very low-emphasis metadata. Accent text is interactive or intentionally branded.

Buttons

Primary buttons use accent.primary and an appropriate inverse/high-contrast text token. Secondary buttons use a neutral surface plus a quiet border. Ghost buttons have no fill. Danger actions use feedback.danger, never green.

Borders

Use border.divider/default/subtle for structure. Accent borders are reserved for active interaction or selection. Do not outline every card, and never use mint borders around standard dark surfaces.

Progress

Completed portion uses accent.primary. The remaining track uses a quiet neutral token. No gradients, multiple status colors, or pure-white tracks in dark mode.

Icons

Default to inheriting nearby text color. Use accent for a primary action or selected state, not decoration. Status icons use the matching feedback semantic family.

Empty states

Use a standard card surface, one small accent icon, a primary title, a secondary description, and one primary action. Avoid a giant bright panel, oversized illustrations, or multiple competing accent treatments.

Navigation

Inactive items use neutral/muted tokens. Selected items use the centralized selected-row treatment and a consistent icon/label state. Hover is subtle. Disabled sections must look disabled, not merely unselected.

Shadows

Light mode may use a very soft shadow where already defined. Dark mode should generally use shadow-none and rely on card/page surface separation.

Appearance toggle

Use the same underlying theme action in Settings and any future logo/sidebar trigger. A half-filled circle icon is the preferred neutral symbol. Its glyph and container must use the existing toggle/icon/border tokens rather than a new color.

9. Copy-and-Paste Claude Implementation Prompt

The CEO can paste the following prompt into Claude with the repository attached. Attach this PDF and the two screenshots in the same conversation.

You are implementing the OHARA light/dark theme from the attached OHARA Theme & Color Implementation Specification v1.0.

OBJECTIVE

Apply the existing semantic theme system consistently across the app. Correct hardcoded, light-only, and incorrectly assigned colors without changing layout, spacing, copy, navigation, data behavior, or component architecture.

SOURCE OF TRUTH

1. The attached implementation specification and its semantic rules.
 2. constants/colors.ts: LIGHT_THEME and DARK_THEME.
 3. useThemeColors() and the approved Figma visual references.
 4. Existing centrally defined derived tokens.
- Do not sample screenshot pixels or invent replacement colors.

NON-NEGOTIABLES

- Never add a component-local hex, rgba, named color, or light-theme fallback when a semantic token exists.
- Dark mode page = background.page (#111111); standard dark card = background.card (#1A1A1A).
- Dark accent = accent.primary (#8FAE8A), not turquoise, mint, or neon green.
- Standard dark card boundaries use border.divider (#2D2D2D) or the designated quiet border token, not accent green.
- Use accent only for primary actions, progress, selected navigation, links, and small intentional highlights.
- Preserve modal scrims as theme-invariant.
- Do not modify GOAL_THEMES during this pass.
- Do not rename goals/Journey files or variables during this pass.
- Do not silently create a new token. Report a semantic gap first.

WORKFLOW

1. Inspect constants/colors.ts and confirm both LIGHT_THEME and DARK_THEME contain every token referenced by components.
2. Search the codebase for raw color literals (#hex, rgba(), rgb(), named colors), direct LIGHT_THEME imports, and light-mode fallback expressions.
3. Exclude intentional artwork/GOAL_THEMES from replacement unless a normal UI surface is incorrectly using them.
4. Map each UI color to its semantic role: background.*, text.*, border.*, accent.*, or feedback.*.
5. Use useThemeColors() in every themed component. Remove local color decisions and raw fallbacks.
6. Implement in this order: dashboard/Today's Focus, EchoTrail, Journey/goal components, Vault, Projects, Constellation.
7. Review each completed area in both light and dark mode before proceeding.

DASHBOARD CORRECTIONS

- Replace the white dark-mode empty-state/hero card with background.card.
- Remove mint/accent borders from standard cards.
- Replace bright mint/cyan actions with accent.primary.
- Use centralized selected-row styling for Journey navigation.
- Use background.card + border.divider for Echo surfaces.
- Replace any pure-white dark progress track with a quiet neutral track; use accent.primary only for completed progress.

TYPOGRAPHY

Keep the shared Typography.tsx mappings centralized. Do not override text colors per screen unless the component has a documented semantic reason. Flag emphasis-sm, badge-text, and active-goal-title instead of assigning arbitrary colors. Proposed defaults: emphasis-sm and active-goal-title -> text.primary. badge-text should be split by badge treatment or supplied by the badge component.

OUTPUT FORMAT

After edits, provide:

- A. Files changed.
- B. For each file: hardcoded colors removed and semantic tokens used.
- C. Remaining raw colors with a reason each is intentional.
- D. Any new semantic gap requiring UI/UX approval.
- E. Light-mode and dark-mode verification notes for each product area.
- F. Confirmation that layout, behavior, GOAL_THEMES, and scrims were not changed.

Stop and report rather than guessing when a color role is genuinely ambiguous.

10. Focused Prompt - First Implementation Batch

Use this shorter prompt when the team wants Claude to repair the visible dashboard first before touching the full app.

Implement only the OHARA dashboard theme correction using the attached specification.

Scope:

- dashboard.tsx and the components it renders directly
- Today's Focus / active-goal or empty-state card
- dashboard project and goal section actions
- Echo card/feed preview on the dashboard
- sidebar selected/inactive/disabled navigation states only if their colors are defined in dashboard shell code

Do not change layout, copy, spacing, routing, data, GOAL_THEMES, or unrelated screens.

Required dark-mode relationships:

- page: background.page = #111111
- standard cards: background.card = #1A1A1A
- primary text: text.primary = #FFFFFF
- secondary text: text.secondary = #B8B8B8
- dividers/boundaries: border.divider = #2D2D2D
- actionable/progress accent: accent.primary = #8FAE8A

Required corrections:

1. Remove the white dashboard hero/empty-state card in dark mode.
2. Remove mint/accent outlines from standard card boundaries.
3. Replace bright mint/cyan colors with the approved accent token.
4. Replace the white dark progress track with a quiet neutral track.
5. Ensure Echo uses background.card and border.divider with no dark shadow.
6. Ensure selected navigation uses the central selectedRow treatment, not a local green.
7. Remove every raw UI color in the scoped files unless it is documented as intentional artwork.

Return a file-by-file token mapping and list every raw color left in scope with its justification.

10.1 Recommended review sequence

- 1 Run the app in light mode and compare overall surface warmth and hierarchy.
- 2 Switch to dark mode and confirm no card or input retains a light surface.
- 3 Check actions and progress for the single approved sage accent.
- 4 Check selected, inactive, and disabled navigation as three distinct states.
- 5 Search the edited files again for raw colors and direct LIGHT_THEME references.
- 6 Capture matching light/dark screenshots for UI/UX approval.

11. Copy-and-Paste Claude QA / Audit Prompt

Run this after implementation. It asks Claude to audit rather than edit first, which makes regressions and remaining hardcoded colors easier to identify.

Audit the OHARA repository against the attached Theme & Color Implementation Specification v1.0. Do not make edits until you return the audit.

Audit for:

- raw #hex, rgb(), rgba(), hsl(), named colors, and direct LIGHT_THEME imports in UI components
- components that reference background.page when they are visually a card, or background.card when they are a page
- dark-mode standard cards that render white or near-white
- accent green used for neutral card borders, large backgrounds, body text, or decoration
- colors that are brighter/more saturated than accent.primary
- pure-white progress tracks or dividers in dark mode
- text variants overridden locally instead of relying on Typography.tsx
- dark-mode shadows that should be shadow-none
- feedback states using only one color instead of their bg/border/text triad
- missing dark values or light-mode fallbacks in theme objects
- GOAL_THEMES accidentally altered or used as general UI color tokens

Return a table with:

1. Severity: blocker / high / medium / low
2. File and component
3. Current color or token
4. Why it violates the specification
5. Required semantic token
6. Whether the fix can be applied safely without design input

Then provide:

- total raw UI colors by product area
- total direct light-theme imports
- unresolved semantic gaps
- an ordered repair plan
- a final PASS/FAIL for dashboard, Echo, Journey, Projects, and Constellation in light and dark mode

11.1 Completion evidence

- A light and dark screenshot of every repaired screen or reusable state.
- A repository search showing no unexplained raw UI colors remain in repaired files.
- A list of intentionally retained values, limited to artwork, invariant scrims, or GOAL_THEMES.
- No visual regression in spacing, layout, component dimensions, or typography hierarchy.
- All buttons, selected states, progress indicators, and links use one consistent accent family.

12. UI/UX Acceptance Checklist

Use this page as the final review before merging a theme implementation pull request.

Done	Area	Acceptance requirement
[]	Global	Light page is warm #F8F4EC; dark page is #111111.
[]	Global	Standard cards are #FFFFFF in light and #1A1A1A in dark.
[]	Global	No standard dark card appears white, cream, mint, or accent-outlined.
[]	Global	The approved accent is #4A7C5F light / #8FAE8A dark.
[]	Global	Accent occupies a small supporting portion of the screen rather than dominating it.
[]	Text	Primary, secondary, muted, inverse, and accent text roles are visually distinct.
[]	Text	Screens do not override shared Typography colors without a documented semantic reason.
[]	Borders	Dividers are quiet and use #E8E5DF light / #2D2D2D dark where applicable.
[]	Buttons	Primary, secondary, ghost, and danger actions are visually distinct and semantically correct.
[]	Progress	Track is neutral; completion fill is accent; no pure-white dark track.
[]	Navigation	Selected, inactive, and disabled rows are separate states.
[]	Echo	Dark surfaces use background.card, quiet divider, and no shadow.
[]	Journey	Normal UI chrome is themed without changing GOAL_THEMES.
[]	Code	No unexplained raw UI color, direct light-theme import, or local fallback remains in repaired files.
[]	Code	Any new semantic token exists in both themes and is documented.
[]	QA	Both modes were reviewed at common desktop and mobile sizes.

12.1 Open design decisions - do not let AI guess

- Final dark value for background.sidebar if the current derived value is not approved in Figma.
- Final semantics for badge-text; filled and neutral badges likely require separate roles.
- Whether emphasis-sm and active-goal-title should adopt text.primary as proposed.
- Whether any GOAL_THEMES gradients need a dark-mode-specific variant after contrast review.
- Whether the future logo/sidebar appearance trigger uses a half-filled circle, sun/moon, or custom mark.

Approval principle

A technically complete theme is not approved until its visual hierarchy matches the Figma reference. Token correctness and visual correctness are both required.

Appendix A. Quick Reference for Engineering

A.1 Never do this

```
// Avoid component-local theme decisions
backgroundColor: '#FFFFFF'
color: '#64E0C1'
borderColor: 'rgba(255,255,255,0.20)'
const cardColor = isDark ? '#181818' : '#FFFFFF'
import { LIGHT_THEME } from '@/constants/colors'
```

A.2 Do this instead

```
const colors = useThemeColors()

// Adapt the exact property access to the existing theme object.
page surface      -> colors.background.page
standard card     -> colors.background.card
important text    -> colors.text.primary
supporting text   -> colors.text.secondary
quiet divider     -> colors.border.divider
primary action    -> colors.accent.primary
status notice     -> colors.feedback.<status>.bg / .border / .text
```

A.3 Raw-color search targets

```
Search source files for:
# followed by 3, 4, 6, or 8 hex characters
rgb(
rgba(
hsl(
hsla(
'white' / 'black' / common named colors
LIGHT_THEME imports outside constants/theme infrastructure
isDark ? color : color fallback expressions
shadowColor and SVG fill/stroke literals
```

A.4 Definition of done

A screen is done only when it uses semantic tokens, renders correctly in both modes, matches the visual hierarchy of the approved Figma reference, contains no unexplained raw UI colors, and has been reviewed without layout or behavior changes.

End of specification
